

Towards data-driven control of general nonlinear systems with stability and performance guarantees

Chris Verhoek, Roland Tóth

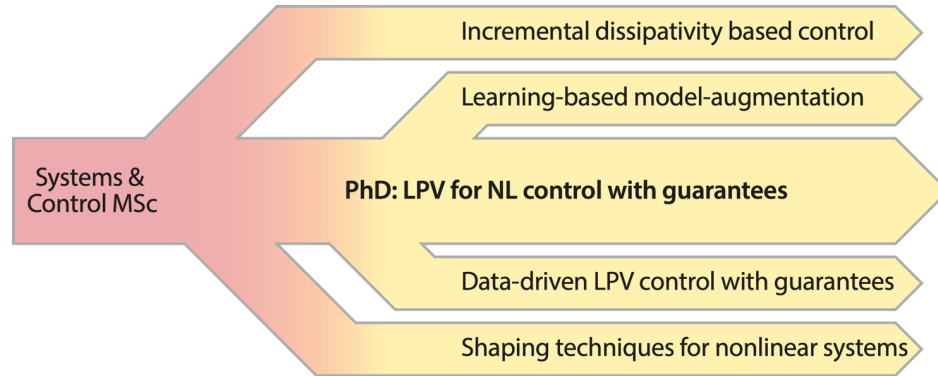

A few things about me

Eindhoven University of Technology (TU/e)

MSc in Systems & Control (TU/e)

PhD @ Control Systems group (EE) since Feb. '21

- Roland Tóth & Sofie Haesaert

A few things about me

Hiking (multi-day trails)

Drumming (jazz)

Motivation

Dynamic systems in engineering

- Increasing performance requirements
- Surge of system complexity
- Nonlinear (NL) behavior is becoming dominant

Industrial practice:

- Linear Time-Invariant (LTI) framework
 - Systematic tools for shaping performance
 - Small operating range
- Need for an NL framework
 - Stability guarantees, but (in general) no performance shaping
 - Non-convex, cumbersome tools

Toolchain based on models

First-principles modeling + model-based control

- Control design with stab. & perf. guarantees
- Complex, inaccurate, costly modelling
- Effect of unmodelled dynamics on the design

Identify system model + model-based control

Toolchain based on models

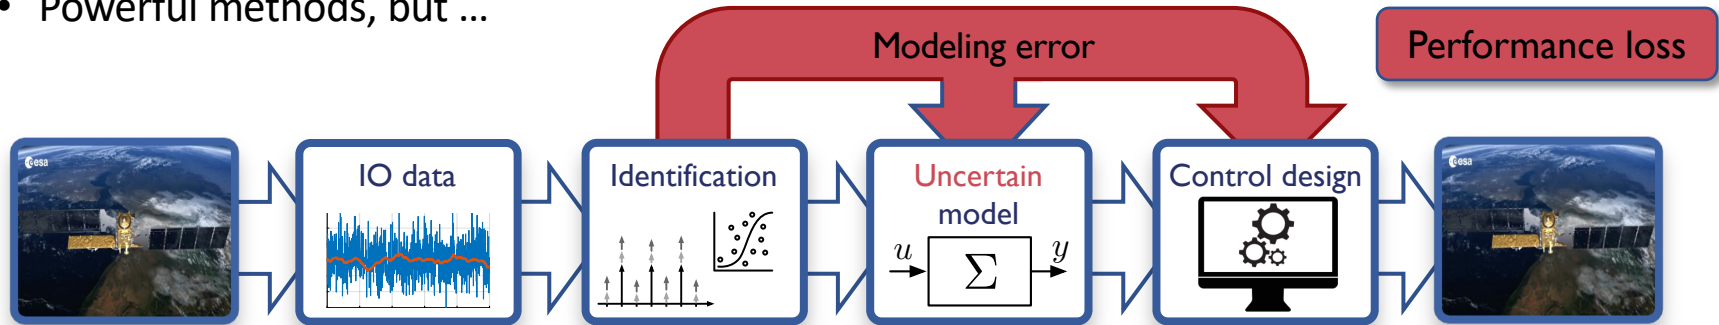

First-principles modeling + model-based control

- Control design with stab. & perf. guarantees
- Complex, inaccurate, costly modelling
- Effect of unmodelled dynamics on the design

Identify system model + model-based control

- Powerful methods, but ...

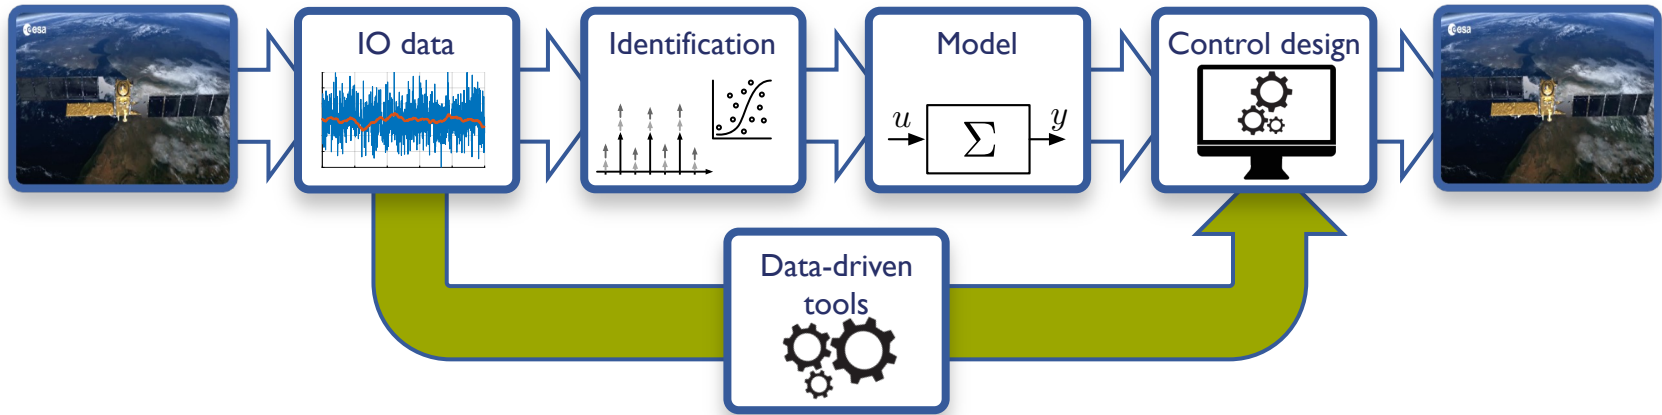

$$\begin{aligned} \min \quad & \text{control cost}(u, y) \\ \text{s.t.} \quad & (u, y) \text{ compatible with model } \mathcal{M} \\ & \text{where } \mathcal{M} \in \arg \min \text{ id cost}(u_{\text{data}}, y_{\text{data}}) \\ & \text{s.t. } \mathcal{M} \in \text{model class} \end{aligned}$$

Direct data-driven control

Direct data-driven analysis and control design

- Joint design with guarantees
- Promising approaches

Direct data-driven control

LTI approaches

- Frequency-domain methods
 - PID tuning [1]
 - Nyquist stability (conservative) [2]
 - Nyquist stability (necessary & sufficient) [3]
 - MIMO stab. through approximation [4]
- Time-domain methods
 - Virtual-feedback reference tuning (VFRT) [5]
 - Non-iterative correlation-based tuning (CbT) [6]
 - Behavioral methods [7,8]
 - Many more ...

LPV approaches

- Time-domain approaches
 - VFRT methods [9]
- Frequency-domain
 - Nyquist-based, conservative [10]
 - Behavioral [12]

NL approaches

- Sector bounded static nonlinearities [13]
- Behavioral (LTI+, Wiener & Ham.) [14-16]

How to address NL systems systematically and give guarantees?

LTI behavioral theory

Behavioral concept (discrete time)

LTI behavioral theory

Kernel representation (**discrete time**)

LTI behavioral theory

Kernel representation (**discrete time**)

$$R(q)w = \sum_{i=0}^{n_r} r_i q^i w = 0$$

Existence of full row-rank
kernel representation

is the representation of the **LTI** system $\Sigma = (\mathbb{T}, \mathbb{W}, \mathfrak{B})$ if

$$\mathfrak{B} = \{w \in (\mathbb{R}^{n_w})^{\mathbb{Z}} \mid R(q)w = 0\}$$

Data-driven LTI behavioral representation

Data-driven representation (**discrete time**)

$$\mathcal{D}_N = \underbrace{\{u_k^d, y_k^d\}}_{w_k^d} \}_{k=1}^N$$

(data dictionary)

Data-driven LTI behavioral representation

Data-driven representation (**discrete time**)

Hankel matrix (L-row):

$$\mathcal{H}_L(w^d) = \begin{bmatrix} w_1^d & w_2^d & \cdots & w_{N-L+1}^d \\ w_2^d & w_3^d & \cdots & w_{N-L+2}^d \\ \vdots & \vdots & \ddots & \vdots \\ w_L^d & w_{L+1}^d & \cdots & w_N^d \end{bmatrix}$$

(data dictionary)

Willems' Fundamental Lemma [17]:

$$\text{image}(\mathcal{H}_L(w^d)) = \mathfrak{B}|_{[1,L]}$$

$$\text{if } \text{rank}(\mathcal{H}_L(u^d)) = n_u(L + n_x)$$

(Persistency of excitation)

$$N \geq (n_u + 1)(L + n_x) - 1$$

Data-driven LTI behavioral representation

Data-driven representation (discrete time)

Hankel matrix (L-row):

$$\mathcal{H}_L(w^d) = \begin{bmatrix} w_1^d & w_2^d & \cdots & w_{N-L+1}^d \\ w_2^d & w_3^d & \cdots & w_{N-L+2}^d \\ \vdots & \vdots & \ddots & \vdots \\ w_L^d & w_{L+1}^d & \cdots & w_N^d \end{bmatrix}$$

(data dictionary)

Data-driven representation:

$$\exists g \in \mathbb{R}^{N-L+1}$$

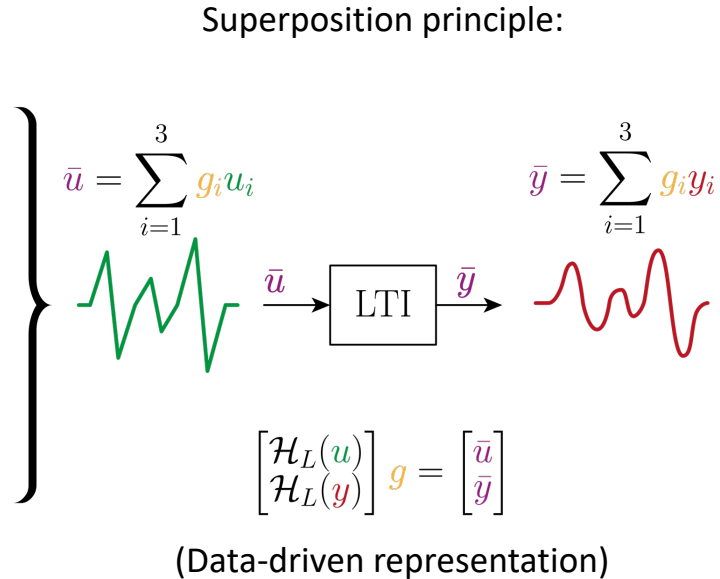

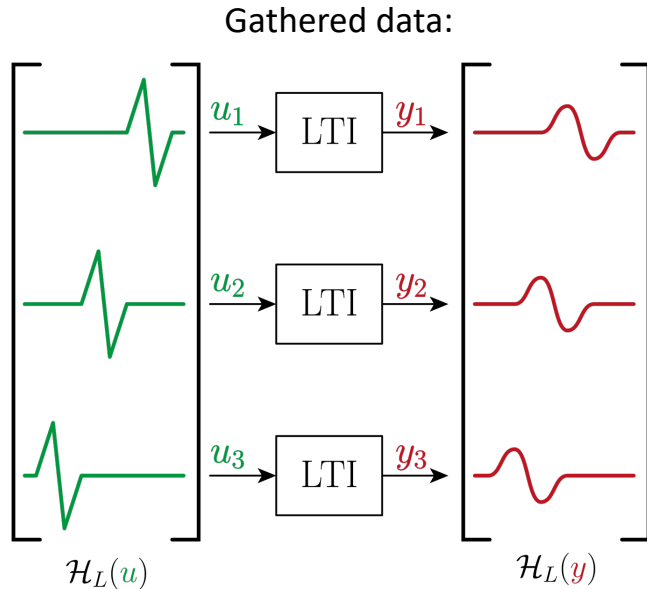

$$\begin{bmatrix} \mathcal{H}_L(u^d) \\ \mathcal{H}_L(y^d) \end{bmatrix} g = \begin{bmatrix} \text{col}(\bar{u}_{[1,L]}) \\ \text{col}(\bar{y}_{[1,L]}) \end{bmatrix}$$

$$\updownarrow$$

$$\text{col}(\bar{y}_{[1,L]}, \bar{u}_{[1,L]}) \in \mathfrak{B}_{[1,L]}$$

Linear parameter-varying framework

The Engineers' Dream:

How to use "simple" linear control for NL systems with performance guarantees?

Linear parameter-varying framework

Local approximation principle

Global embedding principle

Linear parameter-varying framework

Local approximation principle

Local synthesis:
Gain scheduling
(interpolated LTI control)

Global embedding principle

Global synthesis:
Optimal LPV control
(NL control)

Linear parameter-varying framework

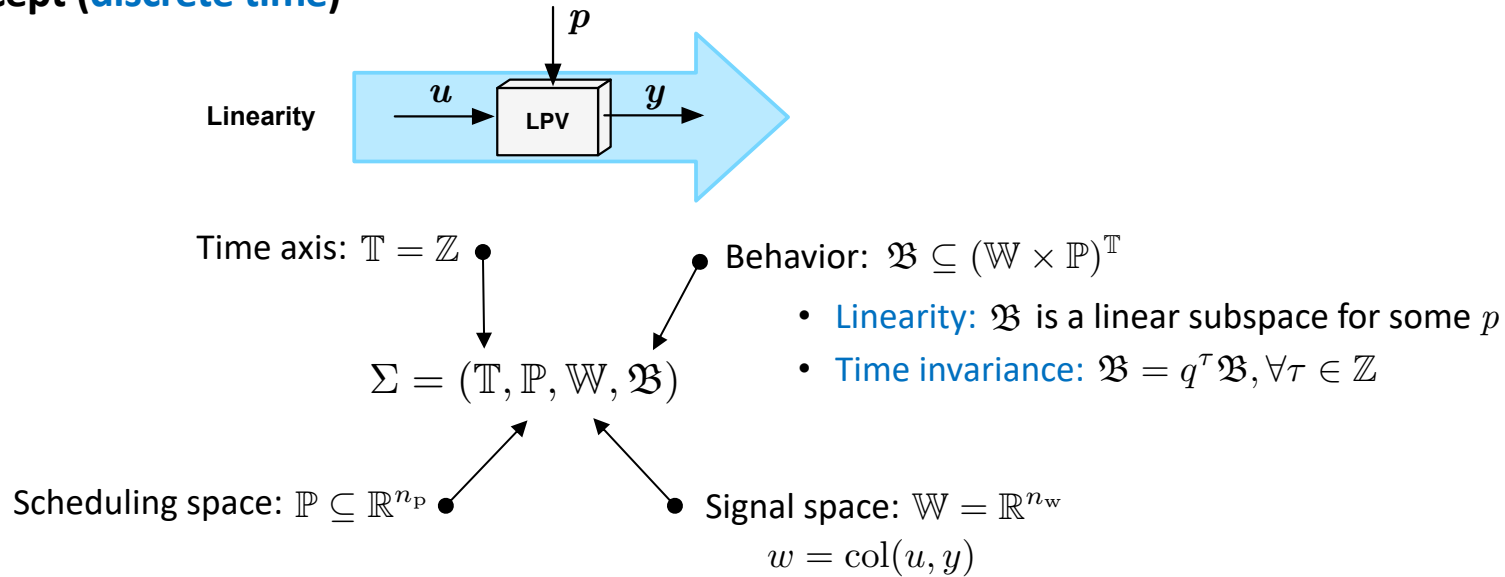

A plethora of success stories via model-based control

Pending question:
How to achieve data-driven LPV control with guarantees?

LPV behavioral theory

Behavioral concept (discrete time)

LPV behavioral theory

Behavioral concept (discrete time)

$$\Sigma = (\mathbb{T}, \mathbb{P}, \mathbb{W}, \mathfrak{B})$$

- Projected scheduling behavior:

$$\mathfrak{B}_{\mathbb{P}} = \pi_p \mathfrak{B} := \{p \in \mathbb{P}^{\mathbb{T}} \mid \exists w \in \mathbb{W}^{\mathbb{T}} \text{ s.t. } (w, p) \in \mathfrak{B}\}$$

- Projected behavior for a given: $p \in \mathfrak{B}_{\mathbb{P}}$

$$\mathfrak{B}_p = \{w \in \mathbb{W}^{\mathbb{T}} \mid (w, p) \in \mathfrak{B}\}$$

LPV behavioral theory

Kernel representation (discrete time)

Coefficient functions:

$$r_i : \mathbb{R}^{n_p} \rightarrow \mathbb{R}^{n \times n_w}$$

Types (static dep.):

- Affine/linear functions
- Polynomial functions
- Rational functions
- Meromorphic functions

$$r(\cdot) = \frac{g(\cdot)}{h(\cdot)} \begin{matrix} \leftarrow \bullet \text{ holomorphic} \\ \nearrow \bullet h \neq 0 \end{matrix}$$

Meromorphic field

$$r_i \in \mathcal{R}^{n \times n_w}$$

$$\sum_{i=0}^{n_r} r_i(p_k) q^i w_k = 0$$

Shift operator: $q^i w_k = w_{k+1}$

Confined in $\mathbb{P} \subseteq \mathbb{R}^{n_p}$

Signals: $w : \mathbb{Z} \rightarrow \mathbb{R}^{n_w}$

Commutation problem (dynamic dependence):

$$q^i r_i(p_k) w_k \neq r_i(p_k) w_{k+i}$$

LPV behavioral theory

Kernel representation (discrete time)

Coefficient functions:

$$r_i : \mathbb{R}^{n_p} \rightarrow \mathbb{R}^{n \times n_w}$$

Types (static dep.):

- Affine/linear functions
- Polynomial functions
- Rational functions
- Meromorphic functions

$$r(\cdot) = \frac{g(\cdot)}{h(\cdot)} \begin{matrix} \leftarrow \bullet \text{ holomorphic} \\ \nearrow \bullet h \neq 0 \end{matrix}$$

Meromorphic field

$$r_i \in \mathcal{R}^{n \times n_w}$$

$$\sum_{i=0}^{n_r} r_i(p_k) q^i w_k = 0$$

Shift operator: $q^i w_k = w_{k+1}$

Confined in $\mathbb{P} \subseteq \mathbb{R}^{n_p}$

Signals: $w : \mathbb{Z} \rightarrow \mathbb{R}^{n_w}$

Commutation problem (dynamic dependence):

$$q^i r_i(p_k) w_k = r_i(p_{k+i}) w_{k+i}$$

LPV behavioral theory

Kernel representation (**discrete time**)

Coefficient functions with finite dynamic dependence

Features:

- Causal

$$r_i(p_k, p_{k-1}, p_{k-2}, \dots)$$

- Non-causal

$$r_i(\dots, p_{k+1}, p_k, p_{k-1}, \dots)$$

$$\sum_{i=0}^{n_r} \underbrace{(r_i \diamond p)_k q^i w_k}_{R(q) \diamond p} = 0$$

Shorthand for evaluation over dynamic dependence

Polynomials over \mathcal{R}

$$R \in \mathcal{R}[\xi]^{n \times n_w}$$

LPV behavioral theory

Kernel representation (**discrete time**)

$$\underbrace{\sum_{i=0}^{n_r} (r_i \diamond p)_k q^i w_k}_{R(q) \diamond p} = 0$$

is the representation of the LPV system $\Sigma = (\mathbb{T}, \mathbb{P}, \mathbb{W}, \mathfrak{B})$ if

$$\mathfrak{B} = \{(w, p) \in (\mathbb{R}^{n_w} \times \mathbb{P})^{\mathbb{Z}} \mid (R(q) \diamond p)w = 0\}$$

Data-driven LPV behavioral representation

Data-driven representation (**discrete time**)

$$\underbrace{\sum_{i=0}^{n_r} (r_i \diamond p)_k q^i w_k}_{R(q) \diamond p} = 0$$

Data-dictionary:

$$\mathcal{D}_N = \{u_k^d, y_k^d, p_k^d\}_{k=1}^N$$

Complex condition

Can we simplify this to an easily computable form / representation?

LPV Fundamental Lemma:

$$\text{span}_{\mathcal{R}, p}^{\text{col}}(\mathcal{H}_L(w^d)) = \mathfrak{B}_p|_{[1, L]}$$

(Persistence of excitation)
existence of a “unique” R w.r.t \mathcal{D}_N .

Data-driven LPV behavioral representation

Data-driven representation (**discrete time, simplified case**)

Consider the **IO** form (partitioned kernel rep.):

$$y_k + \sum_{i=1}^{n_a} a_i(p_{k-i})y_{k-i} = \sum_{i=1}^{n_b} b_i(p_{k-i})u_{k-i}$$

Restricted, but useful
subclass of LPV systems

with **shifted-affine** scheduling dependence:

$$a_i(p_{k-i}) = a_{i,0} + \sum_{j=1}^{n_p} a_{i,j}p_{j,k-i}, \quad b_i(p_{k-i}) = b_{i,0} + \sum_{j=1}^{n_p} b_{i,j}p_{j,k-i}$$

Data-driven LPV behavioral representation

Data-driven representation (**discrete time, simplified case**)

$$y_k + \sum_{i=1}^{n_a} \underbrace{a_i(p_{k-i})}_{p_{k-i} \otimes y_{k-i}} y_{k-i} = \sum_{i=1}^{n_b} \underbrace{b_i(p_{k-i})}_{p_{k-i} \otimes u_{k-i}} u_{k-i}$$

Data-dictionary:

$$\mathcal{D}_N = \{u_k^d, y_k^d, p_k^d\}_{k=1}^N$$

Data-driven representation:

$$\begin{bmatrix} \mathcal{H}_L(u^d) \\ \mathcal{H}_L(y^d) \\ \mathcal{H}_L(p^d \otimes u^d) - \bar{\mathcal{P}}^{n_u} \mathcal{H}_L(u^d) \\ \mathcal{H}_L(p^d \otimes y^d) - \bar{\mathcal{P}}^{n_y} \mathcal{H}_L(y^d) \end{bmatrix} g = \begin{bmatrix} \text{col}(\bar{u}_{[1,L]}) \\ \text{col}(\bar{y}_{[1,L]}) \\ 0 \\ 0 \end{bmatrix}$$

⇕

$$\text{col}(\bar{y}_{[1,L]}, \bar{u}_{[1,L]}, \bar{p}_{[1,L]}) \in \mathfrak{B}_{[1,L]}$$

Data-driven LPV behavioral representation

Simplified LPV Fundamental Lemma (**discrete time**)

Given $\mathcal{D}_N = \{u_k^d, p_k^d, x_k^d\}_{k=1}^N$ and let

$$\mathcal{N}_{\bar{p}} := \text{nullspace} \left\{ \begin{bmatrix} \mathcal{H}_L(p^d \otimes u^d) - \bar{\mathcal{P}}^{n_u} \mathcal{H}_L(u^d) \\ \mathcal{H}_L(p^d \otimes y^d) - \bar{\mathcal{P}}^{n_y} \mathcal{H}_L(y^d) \end{bmatrix} \right\}, \quad \mathcal{S} := \text{span}^{\text{col}} \left\{ \begin{bmatrix} \mathcal{H}_L(u^d) \\ \mathcal{H}_L(y^d) \end{bmatrix} \right\}$$

Then, for all scheduling signals $\bar{p} \in \mathfrak{B}_{\mathbb{P}}$

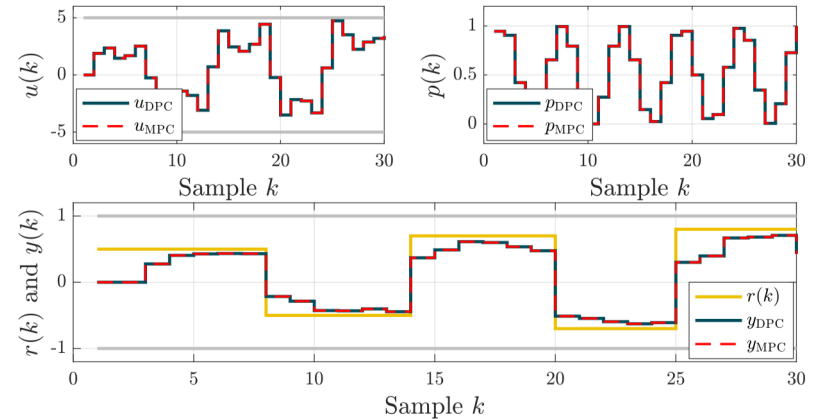

$$\text{Proj}_{\mathcal{N}_{\bar{p}}}(\mathcal{S}) = \mathfrak{B}_{\bar{p}}|_{[1,L]} \iff \dim \left\{ \text{Proj}_{\mathcal{N}_{\bar{p}}}(\mathcal{S}) \right\} = n_x + n_u L$$

- The state-feedback case follows the same arguments

Data-driven LPV behavioral control

Direct data-driven analysis and control design

Data-driven LPV behavioral control

Example (**unbalanced disc**):

Optimal state-
feedback design

Data-driven advantage

LPV controller synthesized using **7** data-points (70 milliseconds)!

Towards nonlinear data-driven control?

Now developed a data-driven behavioral framework for LPV systems

- When underlying system is NL \rightarrow possible unexpected stability restrictions [29]

Data-driven control for nonlinear systems:

- Feedback/online linearizations [28, 29]
- Nonlinearity cancellation [30]
- Koopman-based [31]
- Polynomial systems [32]

Mostly rely on approximations / LTI formulation...

\rightarrow Lacking *global* guarantees
Can we get a bit more general?

Concept of global stability

Nonlinear system (**autonomous, discrete time**)

$$x_{k+1} = f(x_k)$$

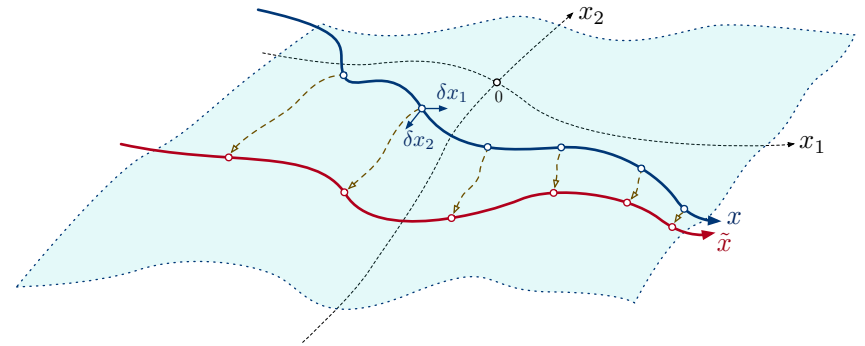

$f \in \mathcal{C}^1$

Concept of global stability

Lyapunov Stability

Core stability concept in the NL/LPV context

Incremental Stability

Convergence of trajectories
(equilibrium free stability)

Can fail in case of tracking!
Closed-loop NL guarantees can be lost.

Concept of global stability

- Krasovskii type of condition
 - Consider the **time difference** form

$$\Delta x_{k+1} = f(x_k) - f(x_{k-1}) \quad \Delta x_0 \in \mathbb{R}^{n_x}$$

$$\Delta x_{k+1} = \int_0^1 \frac{\partial f}{\partial x}(\check{x}_k(\lambda)) d\lambda \cdot \Delta x_k$$

$$\Delta x_{k+1} = \mathcal{A}(x_k, x_{k-1}) \Delta x_k$$

$$\check{x}_k(\lambda) = x_{k-1} + \lambda(x_k - x_{k-1})$$

Concept of global stability

- Krasovskii type of condition
 - Consider the **velocity** form

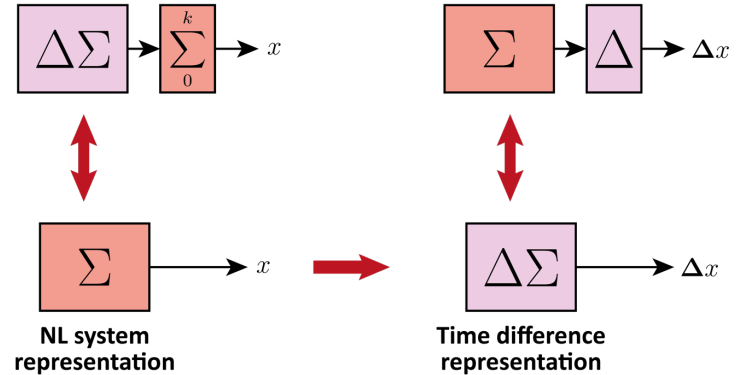

$$\Delta x_{k+1} = \mathcal{A}(x_k, x_{k-1}) \Delta x_k$$

$$\Delta x_0 \in \mathbb{R}^{n_x}$$

Shifted Stability (Asymptotic)

There exists a **KL** function β such that for any $x_0 \in \mathbb{X}$, there is a $x_* \in \mathbb{X}$ s.t.:

$$\|x_k - x_*\|_2 \leq \underbrace{\beta(\|x_0 - x_*\|_2, k)}_{\kappa e^{-ct} \|x_0 - x_*\|_2}$$

Concept of global stability

- Krasovskii type of condition
 - Consider the **velocity** form

$$\Delta x_{k+1} = \mathcal{A}(x_k, x_{k-1}) \Delta x_k$$

$$\Delta x_0 \in \mathbb{R}^{n_x}$$

Shifted Stability (Asymptotic)

There exists a **KL** function β such that for any $x_0 \in \mathbb{X}$, there is a $x_* \in \mathbb{X}$ s.t.:

$$\|x_k - x_*\|_2 \leq \underbrace{\beta(\|x_0 - x_*\|_2, k)}_{\kappa e^{-ct} \|x_0 - x_*\|_2}$$

Shifted Stability (Sufficiency condition)

If there exists a $\mathcal{X} \succ 0$ such that $\forall \bar{x}, \bar{\bar{x}} \in \mathbb{X}$

$$\mathcal{A}^\top(\bar{x}, \bar{\bar{x}}) \mathcal{X} \mathcal{A}(\bar{x}, \bar{\bar{x}}) - \mathcal{X} \prec 0$$

Concept of global stability

- Krasovskii type of condition
 - Consider the **velocity** form
- Quadratic stability

$$\Delta x_{k+1} = \mathcal{A}(x_k, x_{k-1}) \Delta x_k$$

$$\Delta x_0 \in \mathbb{R}^{n_x}$$

$$V(x) = \underbrace{(f(x) - x)}_{\Delta x} \mathcal{X} \underbrace{(f(x) - x)}_{\Delta x} \quad \mathcal{X} \succ 0$$

$$\Delta x^\top \mathcal{A}^\top(qx, x) \mathcal{X} \mathcal{A}(qx, x) \Delta x - \Delta x^\top \mathcal{X} \Delta x \prec 0$$

$$(f(x) - x)^\top \mathcal{A}^\top(f(x), x) \mathcal{X} \mathcal{A}(f(x), x) (f(x) - x) - (f(x) - x)^\top \mathcal{X} (f(x) - x) \prec 0$$

Shifted Stability
(Sufficiency condition)

If there exists a $\mathcal{X} \succ 0$ such that $\forall \bar{x}, \bar{\bar{x}} \in \mathbb{X}$

$$\mathcal{A}^\top(\bar{x}, \bar{\bar{x}}) \mathcal{X} \mathcal{A}(\bar{x}, \bar{\bar{x}}) - \mathcal{X} \prec 0$$

Concept of global stability

- **Velocity stability**
 - Enough to consider the stability of the velocity form

$$\Delta x_{k+1} = \mathcal{A}(\bar{x}_k, \bar{x}_{k-1}) \cdot \Delta x_k$$

Velocity stability

$$\mathcal{X} \succ 0$$

$$\mathcal{A}^\top(\bar{x}, \bar{x}) \mathcal{X} \mathcal{A}(\bar{x}, \bar{x}) - \mathcal{X} \prec 0$$

$$\forall \bar{x}, \bar{x} \in \mathbb{X}$$

Shifted stability

$$V(x) \succ 0$$

$$\Delta V(x) \prec 0$$

$$\forall x \in \mathbb{X}_{x_*} \subseteq \mathbb{X}$$

Concept of global stability

- **Velocity stability**
 - Enough to consider the stability of the velocity form

$$\Delta x_{k+1} = \mathcal{A}(\bar{x}_k, \bar{x}_{k-1}) \cdot \Delta x_k$$

Looks like an LPV form!

Concept of global stability

- **Velocity stability**

- Enough to consider the stability of the velocity form

$$\Delta x_{k+1} = A(p_k) \cdot \Delta x_k$$

Looks like an LPV form!

Quadratic LPV stability

$$\mathcal{X} \succ 0$$

$$A^\top(p) \mathcal{X} A(p) - \mathcal{X} \prec 0$$

$$\forall p \in \mathbb{P}$$

Shifted stability

$$V(x) \succ 0$$

$$\Delta V(x) \prec 0$$

$$\forall x \in \mathbb{X}_{x_*} \subseteq \mathbb{X}$$

LPV embedding
We can guarantee stability via an LPV embedding of the velocity form

[35] Koelewijn, et. al: Incremental Dissipativity based Control of Discrete-Time Nonlinear Systems using the Linear Parameter-Varying Framework, *CDC* (2021)

Concept of global stability

Theory in pictures

Stability

Stability

Stability

Velocity stability

Stability w.r.t. *time-difference dynamics*

Shifted stability

Stability w.r.t. *arbitrary equilibrium point*

Lyapunov stability

Stability w.r.t. the *origin*

Concept of global performance

Theory in pictures

Dissipativity

Dissipativity

Dissipativity

Velocity dissipativity

Stability w.r.t. time-difference dynamics

$$V(\Delta x_{k_1}) \leq V(\Delta x_{k_2}) + \sum_{t=k_1}^{k_2} s(\Delta u_t, \Delta y_t)$$

Shifted dissipativity*

Dissipativity w.r.t. arbitrary storage point

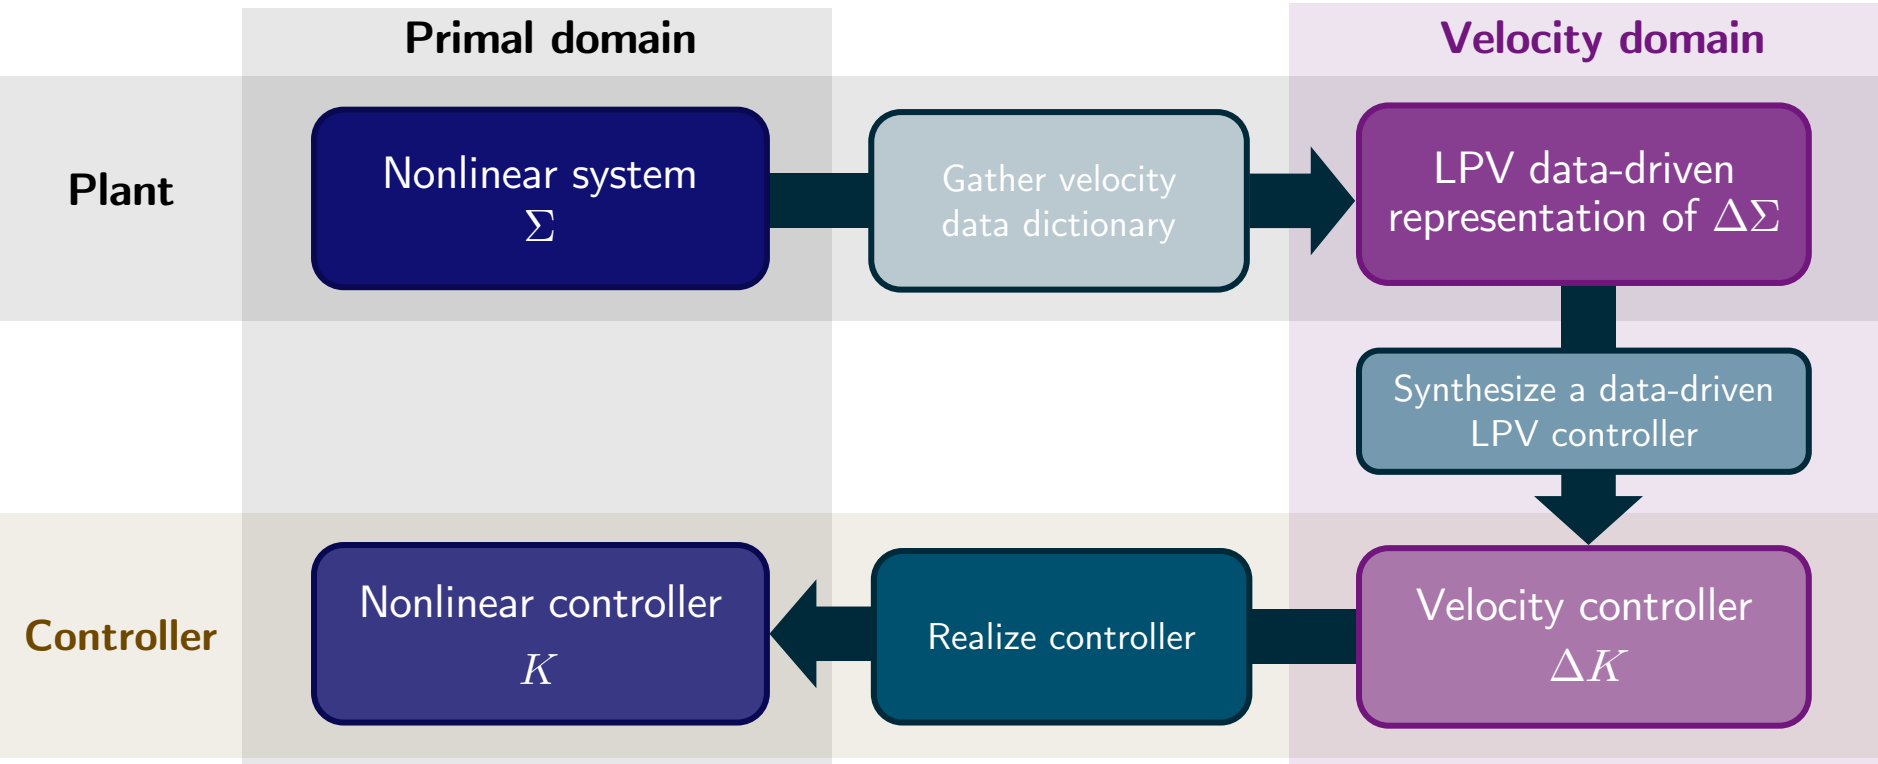

$$V(x_{k_1}, x_*) \leq V(x_{k_2}, x_*) + \sum_{t=k_1}^{k_2} s(u_t, u_*, y_t, y_*)$$

General dissipativity

Dissipativity w.r.t. the origin

$$V(x_{k_1}) \leq V(x_{k_2}) + \sum_{t=k_1}^{k_2} s(u_t, y_t)$$

Data-driven NL controller synthesis

Data-driven NL controller synthesis

- State-feedback synthesis

- Consider the **time difference** form ($w_k = \text{col}(u_k, x_k)$)

$$\begin{aligned}\Delta x_{k+1} &= \mathcal{A}(w_k, w_{k-1})\Delta x_k + \mathcal{B}(w_k, w_{k-1})\Delta u_k, \\ \Delta y_k &= \Delta x_k\end{aligned}$$

- Assume a **given** set of **basis functions** $\psi_1, \dots, \psi_{n_p}$, such that

$$\begin{aligned}\mathcal{A}(w_k, w_{k-1}) &= A_0 + \sum_{i=1}^{n_p} A_i \psi_i(w_k, w_{k-1}) \\ \mathcal{B}(w_k, w_{k-1}) &= B_0 + \sum_{i=1}^{n_p} B_i \psi_i(w_k, w_{k-1})\end{aligned}$$

Data-driven NL controller synthesis

- State-feedback synthesis
 - LPV embedding

$$\begin{aligned}\Delta x_{k+1} &= A(p_k)\Delta x_k + B(p_k)\Delta u_k, \\ \Delta y_k &= \Delta x_k\end{aligned}$$

- Scheduling is defined as

$$p_k := \psi(x_k, u_k, x_{k-1}, u_{k-1})$$

Data-driven NL controller synthesis

- State-feedback synthesis

$$\begin{aligned}\Delta x_{k+1} &= A(p_k)\Delta x_k + B(p_k)\Delta u_k, \\ \Delta y_k &= \Delta x_k\end{aligned}$$

Data-dictionary:

$$\mathcal{D}_{N+1}^{\text{NL}} = \{u_k^{\text{d}}, x_k^{\text{d}}\}_{k=0}^N \quad \rightarrow \quad \mathcal{D}_N^{\Delta} = \{\Delta u_k^{\text{d}}, \Delta x_k^{\text{d}}, p_k^{\text{d}}\}_{k=1}^N$$

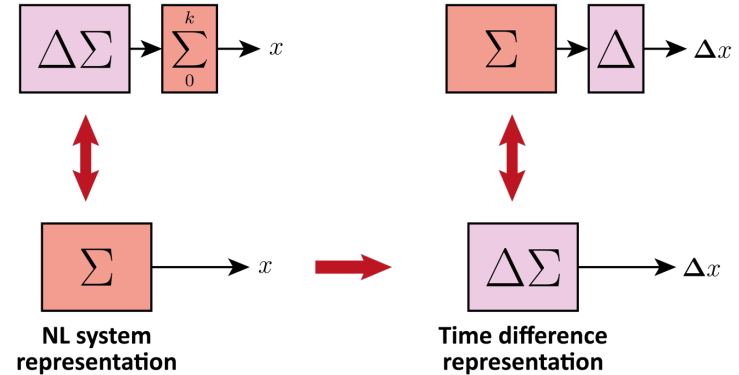

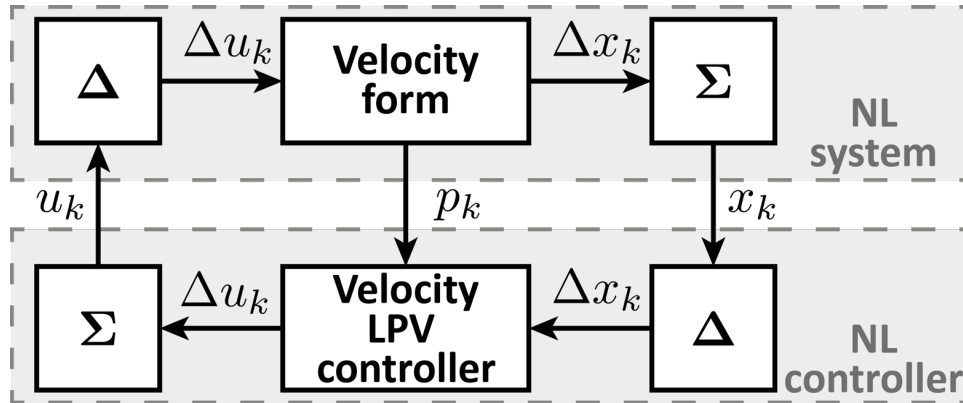

$u_k^{\text{d}} - u_{k-1}^{\text{d}} \quad x_k^{\text{d}} - x_{k-1}^{\text{d}} \quad \psi(x_k^{\text{d}}, x_{k-1}^{\text{d}}, u_k^{\text{d}}, u_{k-1}^{\text{d}})$

- Construct data-driven LPV representation (of velocity form)
- Apply data-driven LPV control synthesis methods

Controller realization

- Controller realization
 - Velocity form (state-feedback case):

$$\begin{aligned}\Delta u_k &= \Delta K(p_k) \Delta x_k \\ &= \Delta K(\psi(x_k, u_k, x_{k-1}, u_{k-1})) \Delta x_k\end{aligned}$$

Controller realization

- **Controller realization**

- Velocity form (**state-feedback case**):

$$\begin{aligned}\Delta u_k &= \Delta K(p_k) \Delta x_k \\ &= \Delta K(\psi(x_k, u_k, x_{k-1}, u_{k-1})) \Delta x_k\end{aligned}$$

- Primal form (**realization**):

$$K^{\text{NL}} \begin{cases} \chi_{k+1} = \begin{bmatrix} 0 & 0 \\ -\Delta K(p_k) & I \end{bmatrix} \chi_k + \begin{bmatrix} I \\ \Delta K(p_k) \end{bmatrix} x_k \\ u_k = \begin{bmatrix} -\Delta K(p_k) & I \end{bmatrix} \chi_k + \Delta K(p_k) x_k \\ p_k = \psi(x_k, u_k, \chi_k) \\ \chi_k = \begin{bmatrix} x_{k-1}^\top & u_{k-1}^\top \end{bmatrix}^\top \end{cases}$$

Preservation of guarantees

Realization preserves shifted stability & dissipativity!

Achievement:

The LPV synthesis is used as a surrogate tool for designing an NL controller with perf. guarantees.

Controller realization

- Unbalanced disc system (**simulation**):
 - Basis functions chosen based on a priori knowledge

Data-dictionary

Data-driven **nonlinear**, **LPV** and **LTI** controller

Table of contents

- Behavioral LTI data-driven control
- Behavioral LPV data-driven control
- Behavioral NL data-driven control
- Conclusions

Conclusions

Effective tools for direct synthesis **NL** controllers from time-domain data

- Using tools in behavioral data-driven LPV framework
- Easy generalization to output-feedback and predictive control case
- General performance objectives (passivity, \mathcal{L}_2 , generalized \mathcal{H}_2 , etc.)

Outlooks

- Data-driven learning of the basis functions
- Scaling up to incremental stability and performance ([reference tracking](#))
- Handling noise and stochastic aspects
- Integration into **LPVcore** (off-the-shelf software solution)
